

# Parallel and Concurrent Systems Report

39226565

Server:

| Component | Requester Interface | Provider Interface |
|-----------|---------------------|--------------------|
|-----------|---------------------|--------------------|

|                       |  |   |
|-----------------------|--|---|
| LUConnectServer       | <ul style="list-style-type: none"> <li>- Database Connection</li> <li>- ClientHandler Interface</li> </ul> | <ul style="list-style-type: none"> <li>- Socket and Client connection management</li> <li>- Wait queue management</li> <li>- Message Broadcasting</li> <li>- Encryption/Decryption</li> </ul> |
| AuthenticationHandler | <ul style="list-style-type: none"> <li>- Database Records</li> </ul>                                       | <ul style="list-style-type: none"> <li>- User registration</li> <li>- User login</li> </ul>   |
| DatabaseHandler       | None   |   |
| ClientHandler         | <ul style="list-style-type: none"> <li>- Database Storage</li> <li>- Authentication</li> </ul>             | <ul style="list-style-type: none"> <li>- Authentication Interface</li> <li>- Message sending/receiving</li> <li>- Command Processing</li> </ul>   |

Client:

| Component       | Requester Interface   | Provider Interface  |
|-----------------|---|---|
| LUConnectClient | <ul style="list-style-type: none"> <li>- Socket Communication</li> <li>- Threading</li> <li>- JSON processing</li> <li>- File Operations</li> </ul> | <ul style="list-style-type: none"> <li>- Connection Management and Status Updates</li> <li>- Authentication</li> <li>- File Transfer</li> <li>- Receiving Messages</li> <li>- Sending Messages</li> </ul> |
| ClientUI        | <ul style="list-style-type: none"> <li>- Client Logic</li> <li>- Input Processing</li> </ul>  | <ul style="list-style-type: none"> <li>- User Interface</li> </ul>  |

### Pattern Used and Justification

The design pattern used was a semaphore pattern or a semaphore-based admission control pattern along with the client-server architecture. This is because the semaphore pattern is useful when trying to limit shared access to a resource, in this case only 3 clients at a time accessing the server. This is also useful for the organized wait queue system, so that rather than being denied access to the chatroom, the chatter would be in a waiting queue where they're told the estimated wait time and the amount of people in the queue, leading to a more comfortable experience.
